

Continued Feasibility and Success of a Non-Opioid Pathway for Postoperative Pain after Ureteroscopy

Mohannad Awad, MD MAS; David Sobel, MD; Nikolas Moring, MS; Kevan Sternberg, MD
University of Vermont Medical Center, Burlington, VT

Purpose and Methods

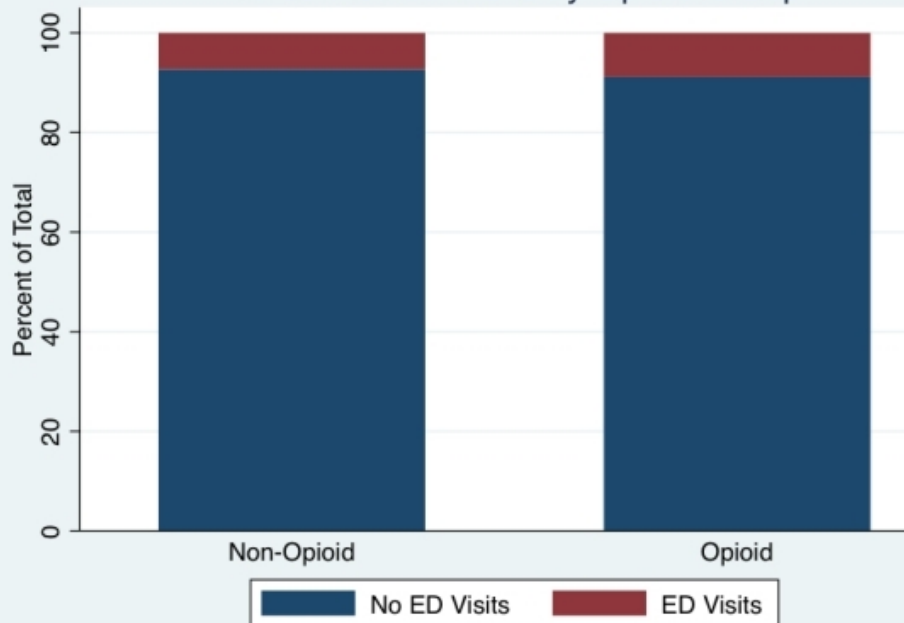

- Determine continued feasibility of non-opioid pathway for postoperative pain after ureteroscopy
- Retrospective chart review: November 2016 to November 2019
- Efforts were made to discharge without patients opioid medications
- Outcomes measured:
 - ED visits
 - Clinic telephone calls for stent related symptoms and pain medication refill requests

Results and Conclusions

Safely discharged 357 / 391 patients (91.3%) without opioids

Only 34 / 391 patients were discharged with opioid medications (8.7%)

Percent of ED Visits by Opioid Group

Percent of Telephone Calls by Opioid Group
