MP29-13 AUTOLOGOUS DERMAL GRAFT IN THE TREATMENT OF PENILE DYSMORPHOPHOBIA

Stojanovic B, Bizic M, Bencic M, Djordjevic ML
Belgrade Center for Urogenital Reconstructive Surgery
- 2014 - 2019
- 34 patients
- Mean age 29y
- Circumcision or penoscrotal approach
- Penile circumference measured in flaccid condition, preoperatively and 6 months postoperatively

Dermal graft is harvested from left gluteal region. Incision line is hidden in the gluteal groove.

Graft is placed along the penile shaft and fixed to Buck fascia.

An 11cm-long dermal graft is prepared.
- Follow-up 6-70 months (mean 32m)
- Circumference gain 0.6-2.5cm (mean 1.22cm)
- Complications: hematoma of the donor region – 3pts, partial penile skin necrosis – 2pts
- 94% of pts satisfied with the result
- Good cosmetic outcome

Preoperative appearance

Result after surgery. Circumference of the penile shaft is enhanced by 2.5cm

Outcome 6 months after surgery
