¹Faculty of Medicine, University of Toronto

²Institute of Health Policy, Management, and Evaluation, University of Toronto

PRISMA & Main Findings

- 11 studies assessed bariatric surgery before KTX
- 10 studies assessed = bariatric surgery after KTX
- Overall mortality, graft failure, and complication rate was low in both subgroups
- Significant improvement in weight and co-morbidities (Type-2 Diabetes, hypertension) following bariatric surgery in the pre-KTX and post-KTX subgroups were demonstrated
- The mean MINORS score was 9.7 (0.99) for the 14 non-comparative studies and 17.7 (2.12) for the 6 comparative studies, representing fair quality of evidence
