AUA Virtual Meeting 2020

UConn
HEALTH

Outline

- Introduction
- Quality Improvement Initiative
- Findings
- Conclusions
- Future Directions

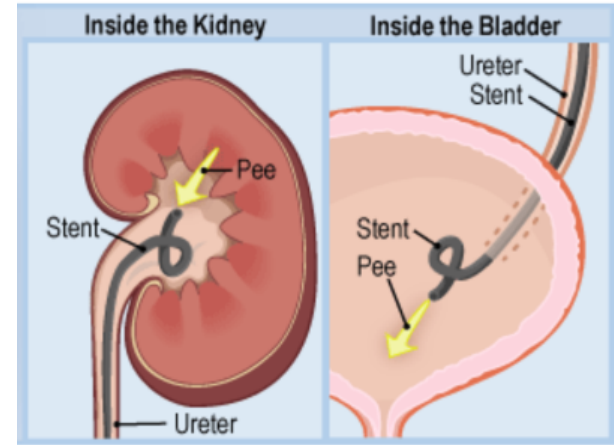

Financial Disclosures

None

Introduction

- Ureteral stents are temporary implants used to bypass obstruction or facilitate healing after surgery
- Standard of care: removal within 3 months to avoid complications
 - Stone formation
 - Obstruction
 - Infection
- Urologists have struggled to keep track of patients with stents and avoid loss to follow-up

KidsHealth® All rights reserved.

UConn
HEALTH

The Problem

- 10-15% of ureteral stents are retained in patients lost to follow-up^{1,2}
- Encrustation affects 50-70% of stents after 12 weeks^{1,3}
- The cost of removal of a retained stent averages 7x higher than timely removal¹
- Around 25% of patients with retained ureteral stent and initially normal renal function will develop CKD⁴
- Between 1995 and 2009, there were 23 malpractice suits involving patients in UK's NHS ruling against urologists for retained stents⁵

The Options

- Status Quo
- Third-party stent tracker applications
 - Costly
 - Privacy issues/HIPAA violations
 - Labor-intensive
 - Do not capture all patients automatically
- Use the existing Electronic Medical Record (EMR)

UConn
HEALTH

Connecticut Children's Medical Center

- 187-bed children's hospital in Hartford, CT
 - Tertiary Care Center, Level 1 trauma
- 4 full-time pediatric urologists

Our Initiative

Use Epic EMR to 1) identify retained stents in our patients and 2) change our workflow to prevent stent retention and ensure timely follow-up

Stent Data in Epic

- OR staff scan barcode to log the implant in patient's chart
 - Status is “Implanted” until time of removal, when OR staff change status to “Explanted”
- Many stents were removed during office cystoscopy or left on string and removed by patient/provider
 - New workflow involves marking these as “Explanted” at removal
- Reporting tools in EMRs like Epic can be used to track all implants system-wide
 - Our report pulls all instances of ureteral stent with status “Implanted”

Connecticut Children's MEDICAL CENTER

UConn HEALTH

Our Findings

- 152 stents from April 2014 to June 2019 had status “Implanted” in Epic
 - 144 were documented in Epic as removed by cystoscopy or string
 - 2 patients had stent for palliation and died with stent in situ
 - 3 patients did not have documentation of stent removal and were contacted
 - All had followed up with outside provider for timely removal
 - The remaining 3 patients had recent stent placement
 - No patient had a retained stent

Conclusions

- Tracking ureteral stents is imperative to prevent significant morbidity and legal liability
- Using existing EMR is a simple, cost-effective, and reliable solution
- At CCMC, we found no instance of ureteral stent retention since Epic launch
- The report is now run on a regular basis to ensure all patients have follow-up
- Next step: deploy the system at regional adult hospitals
